

Quick Reference Install Guide for Speed Control for PSR4000 Parking Sensor (Model: GPS4000)

As an optional part for the PSR4000 digital parking sensors, The GPS4000 is used as a switch when the user needs to limit the starting speed of the front sensor. When the speed of the vehicle less than 5mph, the front sensor function will engage with the brake signal input; when the vehicles speed is higher than 5mph, the front sensor function will turn off.

With this feature, the front sensor will automatically turn on the detection when driving in low speed, effectively helping customers park. It also avoids unnecessary alarms when driving on highways.

Precaution: It may take up to 2 minutes for the GPS connection to establish.
